The reproductive system of sturgeon. One of the main features of the reproductive system of sturgeons is the localization of spermatogenesis. We demonstrated that sperm maturation occurs in sturgeon outside the testes via dilution of sperm by urine. The process involves the participation of high molecular weight (>10 kDa) substances and calcium ions.

Short Communication

In vitro* sperm maturation in sterlet, *Acipenser ruthenus

Future experiments

Protein extraction / separation / purification

PROTEOMIC ANALISYS
(Ms/Ms ; Maldi-TOF)

PROTEIN ID?

Conclusion

Sperm post testicular maturation is an important step that is required to make the sperm able to be motile to fertilize the oocyte.

Achieving the ability to mature the testicular sperm in vitro could be a valid technique in aquaculture to recover sperm that otherwise would be not usable.

This preliminary analysis will give me further information necessary to plan the next steps of my experimental
